JAG IDS identification system – access control and user identification in clean rooms

Da The JAG IDS identification system permits access control to work and operating stations and keeps a continuous record of all user interventions.

It consists of two parts:

- the JAG IDS readers in hygienic design, available in 3 different models.
- the JAG User Manager software application to administer user rights and control access to the establishment.

JAG IDS Desktop USB

User identification at each work and operating station with the JAG IDS reader

- Optimized for use in clean rooms thanks to its hygienic design and good resistance to chemicals.
- Supports contactless tags in three models, including U-KEY keys from existing installations.
- The tags remain on the reader head without having to be held in position. This enables immediate log-out after removing the tag and so permits maximum traceability.
- Available as a built-in reader, desk-top reader and a model for wall mounting.

Administration of user rights with the JAG User Manager

Access control and recording of user interventions are affected in the JAG User Manager. Its principal characteristics are as follows:

- User interface to administer the user rights: which user group has which entitlement in which particular zone? Optional link to an Active Directory to make use of existing user accounts.

- Optional connection to Active Directory to use existing user accounts.
- Background service at the work and operating stations to control access in operation.
- Link-up of third party products possible.
